# WEEKLY HEALTH REPORT

## NATURE OF THE DATA

The data presented here are taken from the Statistical Reports (Form 86ab) rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is promptly requested and the fact that they have been so questioned is indicated by the symbol (:).

### MORBIDITY DATA

In this report admission rates are shown for all causes (disease and injury) combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparison with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per 1000 mean strength which would occur over a year's time if the current week's experience continued through the year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. Appended is a list of cases of the rarer communicable and certain other diseases.

The number of patients remaining in hospital at the end of the week per 1000 strength, as given in this report, furnishes an approximation to the current non-effective rate. The mean number of non-effectives per 1000 strength is given in the summary table for the total United States and for each of the Service Commands.

### HOSPITALIZATION DATA

Current hospitalization conditions are presented in terms of bed capacity (normal and total), beds occupied and beds "available vacant." The number of beds "available vacant" is defined as 80% of the total bed capacity less the corresponding beds occupied. The number of beds "available vacant" for each Service Command is the total of the beds "available vacant" for only those stations in which 80% of the total bed capacity exceeds the beds occupied. Beds in dispensaries, convalescent facilities, venereal disease facilities and college training detachments are not included in this report.

In the case of general hospitals there are shown, in addition, the total number of patients admitted and disposed of each week, the number of patients admitted by transfer and the number of battle casualties admitted and disposed of.

### EXPLANATORY MATTER

In reading the detail tables, it should be borne in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) has been placed after admission rates computed on the basis of 5 or fewer cases.

The symbol # has been placed after the names of stations (or groups of stations) where part or all of the data for the current week has not been received and the latest available figures have been substituted.

Week Ending 13 November 1943

## COMMENT ON CURRENT TRENDS

### CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES AS A WHOLE

As indicated on the chart on page 3, the admission rates from all causes and from all diseases combined both decreased during the week ending 13 November 1943 to the lowest levels yet reached this year; correspondingly, the current morbidity is about 10 percent below that of the corresponding week in 1942. The chart and the year-to-date figures on page 6 have been revised throughout the entire year to reflect the correction made for the Tennessee Maneuver Area as mentioned last week; morbidity rates from all causes combined were lowered by about 20 points on the average for all weeks since May 1943, prior to which time the data were not affected. The admission rate from injury also fell to the lowest point yet attained in recent months.

The rate of admission from colds, influenza, etc., increased about 10 percent over the previous week, but nevertheless was less than one-half as large as the rate prevailing during the corresponding week in 1942.

### VARIATIONS IN MORBIDITY BY SERVICE COMMAND

As was done for the United States as a whole, the past data for the Fourth Service Command has also been changed to reflect the correction made for the Tennessee Maneuver Area; the corrected chart shows that this Service Command has actually had rates of morbidity not widely different from those for the United States as a whole during the past several months. Noteworthy decreases in the admission rate from all causes and from all diseases combined for the current week as compared with the previous one occurred in the Fourth and the Eighth Service Commands and the Military District of Washington, while a sizeable increase was registered in the Sixth Service Command almost entirely as a result of the increase in the admission rate for colds, influenza, etc.

The admission rate from colds, influenza, etc. rose in most of the Service Commands. The increase in the rate for the Sixth Service Command from 155 to 240 per thousand was chiefly caused by the further growth of the out-break at Fort Custer. The morbidity rate for the Seventh Service Command is also substantially higher than those of the remaining Service Commands, while the Fourth and Eighth Service Command continue to show rates below 100 per thousand.

### CURRENT HOSPITALIZATION CONDITIONS.

The total bed capacity increased by about 3000 and on 13 November 1943 was more than 350,000. The number of beds occupied on that date was about 185,000 and the number of "available vacant" beds almost 98,000. There were 26 stations with a total bed capacity of about 17,000 which had no "available vacant" beds; included among them were 5 general hospitals with a bed capacity of about 8,100 beds.

On 13 November 1943 there were 1,447 cases of malaria remaining under treatment, all but 22 of which were presumably acquired outside of the United States. The number of neuropsychiatric cases remaining under treatment at the end of the week was 17,593.

# SUPPLEMENTARY HEALTH REPORT

FIVE WEEK PERIOD ENDING 30 OCTOBER 1943

## PRISONERS OF WAR

During the five week period ending 30 October 1943, morbidity from all causes among prisoners of war was at the relatively low level of about 540 admissions per year per thousand strength, or only about 80 percent of the current level for U.S. troops in the continental United States. The all causes rate was about the same for German and Italian prisoners, but the latter showed a somewhat higher rate from all diseases combined and an appreciably lower one from injury. The injury rate among all prisoners of war combined was nevertheless about the same as for U.S. troops in the continental United States, while the disease rate was considerably lower.

The much lower morbidity from disease among prisoners of war as compared with U.S. troops in the continental United States reflects in part the fact that the rate of admission from respiratory diseases (colds, influenza, pneumonia, etc.) among the former was relatively light, about half the level of that for U.S. troops in the continental United States. On the other hand, prisoners of war showed relatively high morbidity from diptheria and jaundice. The annual admission rate from malaria among prisoners of war (representing cases acquired outside of the United States) was 32 per thousand strength, which is high compared to the current level in this country, but is comparable with rates prevailing in the malarious areas from which many of these prisoners were evacuated. The morbidity from diarrhea and dysentery was about the same as that for U.S. troops in the continental United States.

A number of camps showed all causes admission rates in excess of 1200 per thousand strength. Analysis indicates that in some instances these arose from high injury rates, while in other cases an increase in the number of admissions followed an influx of new prisoners.
